PLOTSPEC

A FORTRAN 77 Program For Plotting Spectral Data From The Varian CARY 2390 UV-VIS-NIR Spectrophotometer

INTRODUCTION

Spectral data acquisition from the CARY 2300 and 2400 series spectrophotometers has been implemented successfully using a Hewlett-Packard 1000 minicomputer system using the FORTRAN 77 program CARYSPEC, which is described in a separate report. The ability to acquire high quality UV-VIS-NIR spectra must be complemented with flexible data analysis and plotting software to make full use of the spectroscopic data. This report describes a fully tested FORTRAN 77 program PLOTSPEC which fulfills the plotting requirements of most users in a simple to use menu driven environment. The program supports Absorbance, Extinction Coefficient, % Transmission and % Reflectance ordinates vs linear Wavelength (nm) or Energy (cm⁻¹) abscissa. Automatic data rescaling is provided between Absorbance units and % Transmission so that either type of data file from CARYSPEC may be plotted in the ordinate of choice. PLOTSPEC supports two concurrent spectra, of up to 10001 data points each, allowing difference spectra to be obtained with automatic scaling for differences in concentration and pathlength. This mode is only valid for Absorbance of Extinction Coefficient ordinate choices and % Transmission data files will be automatically rescaled before plotting. Data treatment in the % Reflectance mode is identical to % Transmission with only the plotting label altered to match the use of this measurement technique. The abscissa axis scaling is bidirectional to suit individual preferences for the direction of increasing wavelength or energy units.

PLOTSPEC has been developed for use with an HP 1000 minicomputer system running the RTE-6/VM operating system and CI shell. In this environment the program communicates with Hewlett-Packard model 9872A and 7550A digital plotters via the IEEE-488 and RS-232C I/O subsystems, respectively. These communication functions are transparent to high level languages on the HP 1000 enabling simple READ/WRITE statements from FORTRAN to control the external plotting operations. The program resides in a single 32K word memory segment and utilizes 79 pages of Extended Memory Addressing (EMA) memory for the large data arrays. Since PLOTSPEC makes use of very few special features of the HP 1000 computer system the program could be modified easily to run on other host systems supporting the FORTRAN 77 language and either the IEEE-488 or RS-232C interface standards.

Manuscript approved August 9, 1988.

IMPLEMENTATION

1.0 Hardware Interface:

The IEEE-488 interface for the HP 1000 system is implemented with an HP 59310B interface card which utilizes 4 Logical Unit (LU) addresses in the system. The LU addresses used within the program are system dependent and are defined during the system generation. The interface card accessed by PLOTSPEC occupies LU addresses 31-34, corresponding to card addresses 0-3. Address 0 enables a special addressing mode for sending low level bus command sequences. Addresses 1-3 are predefined automatic READ/WRITE channels which select device numbers 1-3 on the bus. PLOTSPEC uses LU 33 to automatically address device #2 on the bus (HP 9872A plotter). To simplify alterations to the plotter address the program uses the INTEGER variable PU for the unit number in all READ/WRITE operations with the plotter.

The RS-232C interface to the HP 7550A plotter is implemented via a standard HP 1000 8 channel multiplexer card (MUX) operating at 9600 baud with 8 data bits and XON/XOFF software handshaking protocol. PLOTSPEC does not send device control commands to set these communications parameters within the HP 7550A since these are easy to select from the front panel control of the plotter. In this application the HP 7550A plotter is operated in the STANDALONE mode with DIRECT connection to the MUX output of the HP 1000.

1.1 System Handshaking:

The IEEE-488 subsystem of the HP 1000 is operated by the RTE driver DVA37 configured for ASCII Data Record mode, enabling automatic ASCII \longleftrightarrow NUMERIC conversion on I/O. This mode sends and expects to receive an End Of Record (EOR) with data transmission in the form of a Carriage Return/Line Feed (CR/LF) sequence which matches the requirements of Hewlett-Packard digital plotters.

The RS-232C subsystem is operated by the RTE driver DDV00 which also performs automatic ASCII

NUMERIC conversions for FORTRAN I/O statements. This allows PLOTSPEC to control either plotter without regard for differences in the handshaking protocols. Character labelling mode on these plotters requires a special terminator character and PLOTSPEC issues the default Etx character, ASCII 3.

1.2 HP-GL Software Control Of HP Plotters:

PLOTSPEC uses a subset of the Hewlett-Packard Graphics Language (HP-GL) to control the operations of the HP 9872A and HP 7550A digital plotters. The early generation of HP plotters often only allow scaling and plotting commands to use integer units which restricts the utility of the automatic scaling command 'SC' in these plotters. This lack of utility is so severe that the operating manual for the HP 9872A plotter does not even document the existence of the 'SC' command in the HP-GL syntax. However, PLOTSPEC utilizes a general scaling procedure with the 'SC' command which functions on all models of HP plotters, maintaining a 0-10000 unit scale on each axis at all times. The 'SC' command has the advantage of automatically mapping these user units onto the scaling points P1 (lower left) and P2 (upper right). In order to map the real user units onto this 10000 x 10000 unit grid the program only needs to use a multiplier (XMULT,YMULT) for the data on each axis. For example, a % Transmission range of 0-100% would require YMULT = 100 for correct scaling of the user's data. This technique maintains software resolution at 1 in 10000 units regardless of the range of the user's MIN,MAX values.

PLOTSPEC also supports bidirectional plotting on the X-axis even though the 'SC' scaling command of early HP plotters does not permit setting Xmin > Xmax, i.e. numbers increasing towards the left. In order to accomplish this task in a general manner the program uses two Xmin, Xmax ranges, 0 - +10000 (increasing to the right) and -10000 - 0 (increasing to the left). The change in sign has the effect of reversing the direction of plotting. This scheme is known to work on HP 9872A, 7225A, 7470A, 7475A and 7550A model plotters.

The HP-GL commands used within PLOTSPEC are summarized below together with their syntax and parameter types. The type labels INTEGER and DECIMAL should be interpreted as their ASCII representations. All data sent to or received from the plotters is in ASCII code. Therefore, where the command syntax below indicates a program variable, a parameter value enclosed within literal string delimiters is equally applicable. The HP 1000 computer system performs the conversion between numeric and ASCII representations automatically on I/O operations allowing liberal mixtures of literal string and numeric variables to appear in HP-GL instructions, with a few exceptions. For example, the character plot instruction 'CP' fails on receipt of the value 0.0 from a program variable but happily accepts the literal '0.0'. Where HP-GL commands are known fail to function correctly for valid ranges of parameters PLOTSPEC first converts the values to their string representation before sending them to the plotters.

1.3 HP-GL Commands Summary:

'AP' Automatic Pen Pickup

Syntax = 'AP;'

'CP' Character Plot...moves the pen in units of character width, height

Syntax = 'CP',X,','Y,';'

DECIMAL X,Y

'DF' Default Settings...sets the plotter to default parameters

Syntax = 'DF;'

'DI' Direction...sets the labeling direction Syntax = 'DI',X,',',Y,';' where $X,Y = cos(\theta), sin(\theta)$ DECIMAL X,Y DEFAULT = 1,0

'IP' Input P1,P2 Scaling Points...sets the size of the plot Syntax = 'IP',X1,',',Y1,',',X2,',',Y2,';'

where (X1,Y1) = lower left scaling coordinate (plotter units)

where (X2,Y2) = upper right scaling coordinate (plotter units)

INTEGER X1,Y1,X2,Y2

'IW' Input Window...sets the size of the plotting window

Syntax = 'IW', \(A1,',',Y1,',',X2,',',Y2,';' \)

where (X1,Y1) \(\approx \) lower left soft clip coordinate (plotter units)

where (X2,Y2) \(\approx \) upper right soft clip coordinate (plotter units)

INTEGER X1,Y1,X2,Y2

'LB' Label...draws the following literal characters

Syntax = 'LB', string, Etx where Etx = CHAR(3) terminates LB

ASCII string

'LT' Line Type...solid or broken lines styles

Syntax = 'LT',PN,',',PL,';' where PN = Pattern number (1-6)

INTEGER PN, DECIMAL PL where PL = Pattern length (0-100%)

- 'OA'
 Output Actual Pen Position...sends the current coordinate position
 Syntax = 'OA;' followed by READ (...) X,Y,Z
 where (X,Y) = current position (plotter units)
 where Z = 0 or 1 for pen status (up/down)
 INTEGER X,Y,Z
- 'OP' Output Scaling Points P1,P2...sends the coordinates of plot limits

 Syntax = 'OP;' followed by READ (...) X1,Y1,X2,Y2

 where (X1,Y1) = lower left scaling point

 where (X2,Y2) = upper right scaling point

 INTEGER X1,Y1,X2,Y2
- 'PA' Plot Absolute...moves the pen to an absolute coordinate

 Syntax = 'PA',X,',',Y,';' where X,Y = coordinates (plotter units)

 HP 9872A: INTEGER X,Y

 HP 7550A: INTEGER X,Y or DECIMAL X,Y if user scaling is on
- 'PD' Pen Down...sets the pen on the plotting surface Syntax = 'PD;'
- 'PU' Pen Up...picks up the pen from the plotting surface Syntax = 'PU;'
- 'SC' Scale Plot...maps user units for X,Y axes onto P1,P2 scaling points

 Syntax = 'SC',X1,',',X2,',',Y1,',',Y2,';'

 where (X1,Y1) = coordinate of scaling point P1 (user units)

 where (X2,Y2) = coordinate of scaling point P2 (user units)

 HP 9872A: INTEGER X1,Y1,X2,Y2

 HP 7550A: DECIMAL X1,Y1,X2,Y2
- 'SR' Size Relative...sets the character size in proportion to axes scaling

 Syntax = 'SR', WIDTH,',', HEIGHT,';'

 DECIMAL WIDTH, HEIGHT

- 'SP' Select Pen...picks up the pen from selected stall or carousel position

 Syntax = 'SP', X,';' where X = pen number (0-8)

 INTEGER X
- 'TL' Tick Length...sets the length of positive tick marks for axes

 Syntax = 'TL',X,';' where X = % of full scale (0-100)

 DECIMAL X
- 'VS' Velocity Select....sets the pen down speed

 Syntax = 'VS',X,';' where X = velocity (cm/sec)

 INTEGER X
- 'XT' X-tick...draws a vertical tick mark at the current pen position

 Syntax = 'XT;'
- 'YT' Y-tick...draws a horizontal tick mark at the current pen position Syntax = 'YT;'

1.4 Default Plotting Parameters:

PLOTSPEC initializes the HP plotters using the 'DF' default parameters command and then sets up the following plotting style:

- LABELS The initial label direction is set to horizontal with nominal character fields of 1 x 2 cm and the size relative option is selected.
- PEN Pen #1 is selected with automatic pen pickup and set to the UP state. The pen down velocity is set to 5 cm/sec for best line quality with felt tip pens on graphics paper.
- SCALE Initial scaling coordinates for the HP 9872A plotter are (1350,1000) and (8500,7000) corresponding to the NOTEBOOK size plot on A-size paper while the plotting window is set to the hard clip limits.
- TICKS Tick marks are set to +1% of full scale.

2.0 Purpose Of PLOTSPEC:

This program is intended to provide a flexible plotting facility for spectral data acquired from the Cary 2390 spectrophotometer using the program CARYSPEC, which is described in a separate report. The HP 1000 computer system provides a large EMA area to hold data arrays and PLOTSPEC makes use of this feature to access two concurrent spectra of up to 10001 points each. This allow for difference spectra to be plotted with relative ease compared with the experimental difficulties incurred with real time subtraction. While the raw data from the spectrophotometer consists of Absorbance or % Transmission measurements vs Wavelength (nm), PLOTSPEC allows for presentation of the data in more meaningful units as well. The abscissa may be scaled in Wavelength (nm) or Wavenumbers x 10⁻³ with increasing values towards the left or right. The ordinate may be presented in Absorbance, Extinction Coefficient (Molar Absorptivity), % Transmission or % Reflectance. PLOTSPEC automatically rescales the original ordinate data to match the choice of plotting ordinate. Furthermore, automatic range, tick and label position selection is provided for fast and efficient setup of a neat and tidy plot. However, the user can easily alter the default selections in the menu driven plotting environment.

PLOTSPEC also provides some useful annotation facilities for documenting the plot and for producing presentation material. A digitizing routine is interwoven with the annotation commands to enable semi-automatic labelling of peak maxima with the ease of a point and shoot technique. More accurate determinations of peak maxima can also be made using a page scrolling data listing routine, though the digitizing facility seems to be perfectly adequate in most cases. The default plotting mode produces a small NOTEBOOK size plot on A-size paper, together with a list of spectral parameters for documentation purposes. A FULL size plotting mode can also be selected to produce a larger plot on A-size paper without a parameter list. Both modes include sufficient space for a centered title over the plot. Additionally, the program provides a USER SET plotting size with default boundaries suited for a full size plot on B-size paper. This mode is ideal for producing poster presentation material. PLOTSPEC supports output to two generic types of Hewlett-Packard digital plotters, the older HP 9872A and the more recent HP 7550A model. However, PLOTSPEC is designed to function with all generations of HP plotters with only minor differences in the position of the plotting origin.

2.1 Program Structure:

PLOTSPEC comprises a large main program unit containing the console menu displays, string data for the instrument settings variables and a number of subroutines that perform string processing, input validation and communication with the HP 9872A and HP 7550A digital plotters. The main program unit is responsible for all the logic flow and the subroutines execute specific support tasks, which are summarized below:

The main program unit of PLOTSPEC comprises 6 distinct segments of code to carry out the the functions of disk file data retrieval, instrument settings display, plotting mode setup and actual plotting operations. The code fragments appear under the following assigned labels: MENU, READ, SETTINGS, DIFF, PLOT and EXIT.

MAIN PROGRAM

MENU:

This is the first and main control menu of the program, selecting entry to the data retrieval, instrument settings, plotting mode and exit routines. The choices are as follows:

'R1'Read Spectrum #1

This command branches to label READ and the program performs logical tests for the presence of a valid spectrum in memory before allowing previous data to be overwritten by a new file. The data file format is listed below in Table I. Files are read into the first dimension of the data arrays and may be plotted using the 'P1' command.

'R2'Read Spectrum #2

This command performs the same operation as 'R1' but the file is read into the second dimension of the data arrays. The second spectrum can be plotted independently of the first or used for difference spectroscopy.

'IS'Instrument Settings

This option branches to label SETTINGS and prompts for the number of the spectrum. This routine allows for display of the most important operating conditions of the Cary 2390 spectrophotometer during acquisition of the selected spectrum. This provides an on-line reference when comparing a number of spectra.

'PS'Plotter Selection

This option allows the user to select either the HP 9872A (default) or HP 7550A plotter as the output device. Digitizing is more convenient with the older HP 9872A plotter but output quality and plotting speed are much improved with the HP 7550A.

'P1'Plot Spectrum #1

Selection of this command branches to label PLOT which performs a check for the presence of a valid file in memory. The routine then starts the plotting mode setup for the first spectrum with selection of 'he abscissa and ordinate scaling modes. The user has a choice of Nanometres and Wavenumbers for the abscissa and a choice of ABSORBANCE, Extinction Coefficient, % Transmission and % Reflectance for the ordinate. The program then proceeds to scale the data and set default plotter operating modes before presenting a menu of plotting options. The original data file may have been recorded in either Absorbance or % Transmission units so the data will be rescaled if the choice of plotting ordinate differs from the file ordinate.

'P2'Plot Spectrum #2

This command performs the same operations as 'P1' but uses data residing in the second dimension of the data arrays.

'DS'Difference Spectrum (1-2)

Selection of this option causes a branch to label DIFF which first checks for the presence of two valid spectra in memory and then tests for matching of their wavelength range and step size (nm). If the spectra are matched the program continues to label PLOT in the normal fashion. In this case, however, all plotting operations will use the scaled difference between the two data sets. The data from the second spectrum are scaled for differences in concentration or pathlength before subtraction during plotting.

'EX'Exit

The final option causes an unconditional branch to the label EXIT which terminates the program.

TABLE I

Data File Format

Line	File Variables ^a	Format Type ^b
1	TITLE(2)	CHARACTER (A72)
2	DATE(2)	CHARACTER (A8)
3	FMIN(2),FMAX(2),FSTEP(2),CONC(2), PATH(2)	REAL (*)
4	ORD(2),ABSC(2),CELL(2),CYCLE(2), SAMPLE(2),WAVE(2),TIMER(2), TEMP(2),DIST(2)	REAL (*)
5	J,K,NDATA(2,I)	INTEGER (I3,I3,I6)
6-54	PARAM(2,I)	INTEGER (I2)
55	VARIABLE(2,I)	REAL (*)
56-/	A(2,I)	REAL (*)
/ -e of	W(2,I)	REAL (*)

a: Disk data files are read into either half of the data arrays

b: (*) indicates free field format

READ:

This section of PLOTSPEC opens a disk file previously stored by the data acquisition program CARYSPEC. The data are stored in ASCII code and contain a complete description of the instrument parameter settings as well as the spectral data. The format of the data file is listed above in Table I. The program prompts the user for both the filename and subdirectory. The latter defaults to the user's directory if only a RETURN character is entered. If a directory name is given the program builds a complete CI pathname for use in the OPEN statement. If the file cannot be found or the file is already open the program displays an error message and then returns to the main MENU. Otherwise, the file is read and the file descriptors are displayed on the console while the remainder of the data are being transferred. After completion of the data transfer the program prompts for changes to the concentration or pathlength variables. This feature allows for on-line corrections to the file variables before plotting, though permanent corrections should be made using the file editing program EDITSPEC. The program then returns to the main MENU.

SETTINGS:

This section of code displays a list of the most important instrument settings of the Cary 2390 spectrophotometer during acquisition of the specified spectrum. The program includes a large amount of string data for the various settings in the CHARACTER array Pstr. The INTEGER array PARAM is used as an index to this string data while numeric data for the table are obtained from the REAL array VARIABLES.

DIFF:

Entry into this section of code is made prior to plotting in order to verify that the data in memory are suitable for difference spectral plots. The program first checks that there are two spectra present and proceeds to test for exact matching of the wavelength limits and step size. The editing program EDITSPEC includes routines for preparing subset data files to support the difference plotting mode of PLOTSPEC.

PLOT:

This section of PLOTSPEC allows the user to set up the axes scaling to suit the type of data to be plotted. If the selected spectrum is not present in memory an error message is displayed and the program returns to the main MENU. Otherwise, a prompt is displayed for the choice of abscissa. PLOTSPEC supports two abscissa modes, Wavelength (nm) and Wavenumbers x 10⁻³. After this selection the program sets a number of X-axis plotting variables and calls Subroutine Xaxis to setup the default tick and label positioning. The abscissa is bidirectional allowing the user to select the direction of increasing values. However, the default direction is for values to increase towards the right.

The following prompt is for the choice of ordinate mode. Data may be plotted in a choice of ABSORBANCE, Extinction Coefficient, % Transmission and % Reflectance. The latter pair are identical e cept for the label on the Y-axis. Data files from the CARYSPEC program may contain either Absorbance or % Transmission values so that rescaling is provided automatically to suit the user's choice of plotting ordinate. If the Difference Spectrum mode has been invoked only the Absorbance and Extinction Coefficient ordinates are valid. If the plotting ordinate uses Absorbance data the program will search the data array for the maximum value to provide automatic ranging on the Y-axis. If Extinction Coefficient mode is specified the program also calculates a suitable Y-axis exponent. Otherwise, the Y-axis defaults to 0-100% limits. The default tick and label positions are then set by calling Subroutine Yaxis.

The user is then prompted to check that the selected plotter is connected and turned on before proceeding to send plotter commands. Finally, the user is presented with the plotting menu with default settings for axis and label sizes, line type, pen velocity, the location of tick marks and axis labels and the command interface for plotting, annotating and digitizing.

EXIT:

The final portion of PLOTSPEC issue an erase command line instruction and then terminates the program unconditionally.

2.2 Plotting Menu Commands:

The interactive plotting control menu is designed both for flexibility and ease of use in setting quite a large number of plotting parameters. On most occasions, the default limits and spacing between tick marks and labels will be perfectly satisfactory. However, the user has complete control over these parameters to suit individual preferences. The various command selections are listed below:

'PL'Plot Limits

This command sets the actual range of the data file to be plotted. The default value is the full scan range. If the plotting scale is made smaller than the scan range the plot limits are reduced to match in order to prevent attempts to plot off scale data. If the plotting scale is made larger than the scan range the plot limits are set to the actual scan limits.

'XS'X-scale

The range of the X-axis plotting scale defaults to the scan range of the spectrum but may be made larger or smaller than the scan limits. The XMIN,XMAX values may be entered in reverse order to produce a plot with values increasing towards the left. These limits are passed to Subroutine Xaxis to reset the plot limits, tick marks and label positions automatically.

'XT'X-tick Spacing

This option allows for customizing the X-axis tick mark spacing with prompts for First, Last and Space. The limits are validated to lie within the current X-scale range and the label positions are automatically reset to match the tick positions.

'XL'X-label Spacing

This option allows the user to reset the automatic label positioning. The entries for First, Last and Space are treated in a similar manner to the tick marks.

'YS'Y-scale

The range of the Y-axis plotting scale defaults to the MIN, MAX scale appropriate for the selected ordinate. For %R and %T scales the default scale is 0-100%. For Absorbance and Extinction Coefficient ordinates autoranging is used to fit the entire spectrum on scale. The scale range is passed to Subroutine Yaxis to reset the plot limits, tick marks and label positions automatically.

'YT'Y-tick Spacing

This option allows for customizing the Y-axis tick mark spacing with prompts for First, Last and Space. The label positions are automatically reset to match the tick marks. No input validation is provided for the limits as it is assumed the user can read the updated console display before plotting.

'YL'Y-label Spacing

This option allows the user to reset the automatic label positioning. The entries for First, Last and Space are treated in a similar manner to the tick marks.

'CS'Char.Size

The size of character labels can be altered to suit individual preferences. However, the size should not be made much larger than the default fields (1x2 cm) when using the NOTEBOOK or FULL size axes definitions since the labels may not fit within the hard clip limits of the plotters.

'PV'Pen Velocity

Plotting quality is very dependent on the pen speed, the type of pen and plotting medium chosen. The program uses a default pen speed of 5 cm/sec for both the axes and spectrum plots. The user can alter these within the range 1-36 cm/sec. While the manual for the HP 7550A plotter recommends a speed of 50 cm/sec for the combination of felt tip pen and graphics paper there is no doubt that this is determined more by the quest for throughput than quality. Roller ball pens also work well at the 5 cm/sec pen speed. Thus, there is little need to alter the default values in most cases though transparency plots can benefit from a higher speed (10 cm/sec).

'LT'Line Type

The plotters have 6 inbuilt line type functions. The default value specifies a SOLID line. Since PLOTSPEC can plot multiple spectra on the same graph the BROKEN line type function is quite useful. The various patterns can be found by reference to the plotter manuals. The length of the patterns is entered as a % of full scale and a useful guide is to select the same length as the pattern number.

'AX'Axes Size

The program includes three, predefined plot types NOTEBOOK, FULL and USER SET. The plotting boundaries vary to suit different functions and paper sizes. The default NOTEBOOK size is a small, A-size plot which allows room for labelling a list of spectral file parameters on the right hand margin. The FULL size plot nicely fills the plotting area of A-size paper with sufficient space for a centered Title over the plot. The USER SET size allows for custom size plots up the the limits of B-size paper. This mode has predefined limits which produce a FULL size plot on B-size paper but the scaling coordinates can be easily altered by the user to suit individual needs.

'AN'Annotate Plot

This command allows the use to enter, move and plot Labels, a list of spectral Parameters or a centered Title. The Title defaults to the data file descriptor but the user can enter a new Title if required. The Parameters option is only valid for the NOTEBOOK size plot which allocates room for these descriptors in the right hand margin. The Labelling options allows for entry of descriptive text (up to 40 chars.) which may be positioned and drawn anywhere on the plotting surface. The character size and labelling direction are selectable while the plotting mode supports centered, left and right justification. The character size for labels defaults to 0.6*Normal plot size.

'PA'Plot Axes

This command draws the axes grid according to the selected tick and label positions listed in the plotting menu.

'PS'Plot Spectrum

Before proceding with the plot this command pauses for the possible entry of a step multiplier. This allows the user to speed plotting for very large data files.

'DD'Digitize/Display Data

The program supports manual use of the plotters for digitizing peak positions from the plot. This routine will allow the user to annotate the plot at these positions with either the X coordinate, the Y coordinate or Both. Labels are drawn with small characters in the vertical direction and may be plotted in centered, left or right justified format. In this case, the annotation routine provides offsets to avoid writing over the spectrum.

2.3 COMMON DATA:

All COMMON variables used by PLOTSPEC are held in named COMMON blocks. The variables contained within the COMMON blocks are listed below:

/DATA/	Contains	EMA	REAL	Arrays	of	spectroscopic	data
--------	----------	------------	------	--------	----	---------------	------

A Array containing the Absorbance or %T data

Values read from disk data file

Values used in main program unit

W Array containing the wavelength data (nm)
Values read from disk data file
Values used in main program unit

/DIGIT/ Contains REAL and INTEGER variables for scaling digitized data

FACTOR REAL variable for scaling absorbance to extinction coefficient units

Values set in main program unit (from data file variables)

Values used in main program unit and Subroutine Digitize

XMIN, REAL variables containing the current X-axis limits

XMAX Values set in main program unit

Values used in main program unit, Subroutine Digitize, Subroutine Order and

Subroutine Xaxis

YOFF, REAL variables containing the current Y-axis offset & scale length

YSCALE Values set in main program unit

Values used in main program unit, Subroutine Digitize, Subroutine Order and

Subroutine Yaxis

IX,IY INTEGER variables containing the coordinates of the digitized point
X1,Y1 INTEGER variables containing the coordinates of the scaling points P1,P2
X2,Y2 Values set in main program unit and Subroutine Digitize

Values used in main program unit and Subroutine Digitize

/XPARAM/ Contains REAL variables for plotting control

LMIN, Current X-axis plotting limits for validation of Tick or Label entries

LMAX

WN, WX Current plotting limits for Wavelength or Wavenumber scale

Xtick, X-axis tick mark spacing

FXT,LXT First and Last X-axis tick marks

Xlabel, X-axis label spacing

FXL,LXL First and Last X-axis labels

Values set in Subroutine Xaxis

Values used in main program unit

/YPARAM/ Contains REAL variables for plotting control

Ytick, Y-axis tick mark spacing

FYT,LYT First and Last Y-axis tick marks

Ylabel Y-axis label spacing

FYL,LYL First and Last Y-axis labels

Values set in Subroutine Yaxis

Values used in main program unit

2.4 SUBROUTINES:

PLOTSPEC uses subroutines to perform specific tasks which are required more than once, including string manipulations, input validation, digitizing and data rescaling. The purpose and calling sequences are listed below:

Center(TITLE)

Prints a string on the user console centred within a 72 column line.

TITLE CHARACTER*72 string, contents set by calling unit

CALLED BY: Main program unit

CALLS: None

Coeff(E,String,K)

Converts a numeric extinction coefficient into a rounded string with exponent, if required. Special handling is executed for 0.0000 and 1.0000 values.

E REAL variable input from calling unit

String CHARACTER*(*) output containing floating point string

DIMENSION is set by the calling unit

K INTEGER variable input from calling unit specifying the number of digits of precision required in string. Output value returns the number of characters in string to the calling unit.

CALLED BY: SUBROUTINE Digitize
CALLS: SUBROUTINE Str

Digitize(X,Xcode,Y,Ext,K)

Reads the current pen position from the plotter and converts the coordinates to the user's units. The routine also converts the Y-coordinate to extinction coefficient format. The main program determines whether the latter value is valid for the ordinate mode in use.

X REAL variable output containing the abscissa value in user units

Xcode CHARACTER variable input used to select scaling of the abscissa units

Y REAL variable output containing the ordinate value in user units

Ext CHARACTER*(*) output string containing the extinction coefficient DIMENSION is set by the calling unit

K INTEGER variable input to specify the number of digits precision in Ext

Output value contains the number of characters in the returned string

CALLED BY: Main program unit

CALLS: SUBROUTINE Coeff

Exponent(N,Mult)

Converts the scale factor (power of 10) for extinction coefficient mode into string exponents for labelling the Y-axis in the screen menu and on the plotted graph (e.g. '1E-3' or '1 ...').

N REAL variable input, power of 10

Mult CHARACTER*(*) output string containing multiplier

DIMENSION is set by the calling unit

CALLED BY: Main program unit
CALLS: SUBROUTINE Str

Line(N)

Prints a line of '-' characters to the user console N columns wide and centred within a 72 column line.

N

INTEGER variable input from calling unit

CALLED BY:

Main program unit

CALLS:

None

Order(MIN, MAX)

Validates the input arguments so that MIN < MAX

MIN, MAX REAL variables input and output with order swapped if required

CALLED BY:

Main program unit

CALLS:

None

Rescale(J,K,ND)

Converts ordinate data array between Absorbance units and % Transmission. The data array A(J,I) is accessed from EMA COMMON.

J INTEGER variable input (1 or 2) to specify the spectrum

K INTEGER variable input (0 or 1) to specify the scaling procedure. The original value for K is obtained from PARAM(J,1) in the data file. On return to the main program unit the latter parameter is altered to reflect the

current data format.

ND INTEGER variable input containing the number of data points in A(J,I)

CALLED BY:

Main program unit

CALLS:

None

Str(VALUE,String,PREC)

Performs a conversion from numeric value to a string number for floating point numbers only with up to 12 digits precision.

VALUE REAL variable input to be processed by the routine

String CHARACTER*14 string output corresponding to VALUE

PREC INTEGER variable input to set the rounding precision for string

CALLED BY: Main program unit, SUBROUTINE Coeff, SUBROUTINE Exponent

CALLS: None

Upper(Code)

Performs a check for lower case characters in a string of arbitrary length

and converts to upper case if necessary.

Code CHARACTER*(*) variable passed into routine and UPPER case on exit

DIMENSION is set by the calling unit

CALLED BY: Main program unit

CALLS: None

EXTENSION: LEN(string) function, an HP extension to FORTRAN 77

Val(String, VALUE)

Performs a conversion from string to numeric value for a string number

containing up to 10 digits. This is more than required by PLOTSPEC.

String CHARACTER*(*) string input to be processed by routine

DIMENSION is set by calling unit

VALUE REAL variable output

CALLED BY: Main program unit

CALLS: None

Wait(DELAY)

Performs a loop which tests the system clock until DELAY seconds have elapsed. The routine does not make provision for the special case at the transition to 2400 hours.

DELAY REAL variable holding the value of the delay period in seconds

CALLED BY:

Main program unit

CALLS:

FUNCTION Time(I)

Xaxis(XL,XH)

Performs both limits settings for the X-axis range variables and selection of the default Tick and Label positions. The routine starts with Xtick set to 1/10 of the full scale range and then compares this with a table of preferred values. If the range is anomalously small or large the Tick and Label positions are based on the 1/10 scale spacing. Otherwise, a neat and tidy spacing is selected from the table values with a label at every other tick position.

Yaxis(YSCALE)

Performs Tick and Label position selection using preferred table values, if possible. The routine start with Ytick equal to 1/10 of YSCALE. If the ordinate uses Extinction Coefficient scaling or the range is anomalously small or large the Tick and Label positions are based on the 1/10 scale spacing. Otherwise, a neat and tidy spacing is selected from the table values with a label at every other tick position.

2.5 FUNCTIONS:

PLOTSPEC uses only one function subprogram that makes an EXEC call to read the system time.

Time(I)

Performs an EXEC call to read the system clock and converts the reading to seconds and centiseconds.

I Dummy argument

CALLED BY: SUBROUTINE Wait only

CALLS: EXEC(ICODE,ITIME) system level command

PROGRAM CODE

3.0 Source Code Availability:

The source code for program PLOTSPEC is a 73K ASCII text file available on either a Hewlett-Packard cartridge, 9 track tape or an IBM 360K format floppy disk. All requests should be accompanied by the blank medium desired. A printed copy of the source code is listed below.

3.1 Variable Names And Usage:

A complete listing of the INTEGER, REAL, REAL Array and CHARACTER variables for the MAIN segment of PLOTSPEC is given below in Tables II, III, IV & V, respectively. The subroutines use the same names as the main program for the same variables. Additional variables in the subroutines and simple integers, I-N, are not documented since their usage is rather obvious. The logical variable MATCH is used within the program when comparing two spectra for the difference spectrum mode.

Table II

Glossary of INTEGER Variables

Name	Description	Value
DIFF	Assigned Label - Difference Spectrum	370
EXIT .	Assigned Label - Terminate Program	9000
MENU	Assigned Label - Main Control Menu	10
PLOT	Assigned Label - Plot Spectrum, 1 or 2	400
READ	Assigned Label - Read Spectrum, 1 or 2	570
SETTINGS	Assigned Label - Scan Conditions, 1 or 2	300
ASCII	ASCII equivalent of digits in Str	48-57
FINISH	Index of final abscissa value to plot	1 -1 0001
IX,IY,IZ	Plotter position variables READ/WRITE	0-16000
NCOL	Number of screen columns in menu display	50-70
ND	Number of data points in plotted spectrum	1-10001
NP	Number of parameters to read from file	49
NV	Number of variables to read from file	14
PREC	Precision for rounding function in Str	3,4
PN	Plotter model selection number	1,2
PU	Plotter Logical Unit #, READ/WRITE	17,33
PXOFF	Plotter X-zero position offset	0,200
PYOFF	Plotter Y-zero position offset	0,100
START	Index of first abscissa value to plot	1 -1 0001
UX1,UX2	Absolute Plotter scaling coordinates,	0-16000
UY1,UY2	USER size plot dimensions	0-10100
X1,X2	Plotter X & Y coordinates for reading	0-16000
Y1,Y2	soft clip windowing points	0-10100
XP1,XP2	Absolute Plotter scaling coordinates,	0-16000
YP1,YP2	for WRITE to plotter	0-10100
NDATA(2)	Number of data points in spectrum	1-10001
PARAM(2,49)	Instrument operating modes table	1-16

Table III

Glossary of REAL Variables

Name	Description
BAND	Spectral Bandwidth (nm) - AUTO GAIN mode
BHEIGHT	Large label character height
BWIDTH	Large label character width
COFF	Character offset variable, labelling mode
ESCALE	Y-axis scale length, Ext. Coeff. mode
EMULT	Power of 10 for scaling, Ext. Coeff. mode
EOFF	Y-axis offset, Ext. Coeff. mode
FXL,LXL	First & last X-axis labels
FXT,LXT	First & last X-axis tick marks
FYL,LYL	First & last Y-axis labels
FYT,LYT	First & last Y-axis tick marks
GAIN	Instrument gain - AUTO SLIT mode
HEIGHT	Normal label character height
LHEIGHT	Small label character height
LWIDTH	Small label character width
LMIN	Current X-axis lower limit, data entry check
LMAX	Current X-axis upper limit, data entry check
NUMBER	General purpose data entry variable
PMIN	Pen scale minimum limit
PMAX.	Pen scale maximum limit
RATIO	General purpose scaling variable
STEP	Step size (nm) interval, plotting mode
T1,,T4	Powers of 10 (10,,1E4)
WIDTH	Normal label character width
WN,WX	Current plot limits, default = WMIN, WMAX
WMIN,XMAX	Absolute scan limits (nm) or (kK)
X,Y	General purpose plotting variables
Xlabel	X-axis label spacing
XMIN,XMAX	Left & Right edges of X-scale on plot
XMULT	Multiplier to scale user X-scale to 10000 units
XOFF	Offset to user X-scale units to set min'm at 0
Xtick	X-axis tick spacing
XN,XX	Data entry variables for X-scale, ticks & labels
YN,YX	Data entry variables for Y-scale, ticks & labels
Ylabel	Y-axis label spacing
YMULT	Scales Y-axis data & labels for Ext. Coeff. mode
YOFF	Offset variable on current Y-axis scale
YSCALE	Current Y-axis scale length Y-axis tick spacing

Table IV

Glossary of REAL Array Variables

Name	Description
ORD(2)	Final ordinate value in file
ABSC(2)	Final abscissa value in file
CELL(2)	Final cell # value in file
CYCLE(2)	Final cycle # value in file
SAMPLE(2)	Final sample # value in file
WAVE(2)	Final wavelength value in file
TIMER(2)	Final time value in file
DIST(2)	Final distance value in file
A(2,10001)	Absorbance or %T array
CONC(2)	Concentration of sample (M), from data file
FACTOR(2)	Concentration * Pathlength for scaling spectra
FMAX(2)	Starting wavelength of scan (nm)
FMIN(2)	Ending wavelength of scan (nm)
FSTEP(2)	Step size (nm), from data file
PATH(2)	Pathlength of sample cell (cm), from data file
VARIABLE(2,14)	Instrument operating conditions table
W(2,10001)	Wavelength array

Table V

Glossary Of CHARACTER Variables

Name	Description

Screen Control:

20				washington, b.C. 20373-3000
21			WDITTEN.	February, 1987
22			WKIIILW.	rebidary, 1907
23			VERSION:	1 72
24			VERSION.	1.72
25			PFVISED.	March, 1987:
26			REVISED.	- Debugged plotting DO loops
27				- Added Ordinate/Abscissa mode checks
28				- Added ending wavelength check
29				
30				April, 1987:
31				- Altered to use expt'l X-values
32				- Added screen display routine
33				- Removed rounding from SUB Xlimits
34				- Altered rounding to use NINT function
35				Artered rounding to use with runerion
36				May, 1987:
37				- Altered annotation mode to support
38				Title, Parameters & Labels on plot
39				- Altered AXES selection to provide
40				default USER values & easy updates
41				- Changed FFRCL to 79 characters to
42				prevent unwanted line wrapping
43				prevent disanted time stapping
44				June, 1987:
45				- Altered Filename convention to match
46				the directory structure of the new CI
47				operating system
48				- The program had to be stripped down
49				to run under the CI operating system
50				by eliminating most I/O error checks
51				by eliminating most 1/0 eliot checks
52				July, 1987:
53				- SECMENTED versions of the full size
23	C			- Scommatch versions of the full Size

54 C	program failed with Memory Protect
55 C	errors at the INQUIRE statement if
56 C	the file existed already
57 C	the fite existed affeady
58 C	August, 1987:
59 C	_
	- Eliminated INQUIRE statement for file
60 C	exists or open check to avoid system
61 C	crash in the segmented version of the
62 C	program. The error checks are now made
63 C	using error numbers returned in the
64 C	OPEN statement.
65 C	
66 C	April, 1988:
67 C	- Removed needless DATA for Pstr. unused
68 C	
69 C	arrays and most I/O error checks on
	WRITE to allow room for the complete
70 C	program in a single 32K word segment.
71 C	 Added Uppercase string conversion
72 C	routine for all string entries.
73 C	- Subroutines Xlimits & Ylimits were
74 C	replaced by Subroutine Order(MIN, MAX)
75 C	- Subroutine Xaxis was added to avoid
76 C	duplication in setting X-axis Limits,
77 C	Xtick and Xlabel spacing.
78 C	- Subroutine Yaxis was added to avoid
79 C	
80 C	duplication in setting Y-axis Limits,
	Ytick and Ylabel spacing.
81 C	- Altered Annotation Mode For Labels Up
82 C	To 40 Characters In Centered, Left &
83 C	Right Justified Formats. Positioning
84 C	& Character Size Commands Were Added.
85 C	- The Pen Position Digitizing Routine
86 C	Was Rewritten In Subroutine Form And
87 C	A Labelling Command Added To The Menu.
88 C	- The Annotation Routine Was Augmented
89 C	To Support Peak Position Labels In
90 C	Centered, Left & Right Justified Modes
91 C	With Special Offset Features To Avoid
92 C	Writing Over The Spectrum.
93 C	- % Transmission & % Reflectance Modes
94 C	Were Added To The Y-scale Selections.
95 C	- Re-scaling Between %T & Absorbance
96 C	Was Added To Support Both Plotting
97 C	Modes From Either Type Of Data File.
98 C	- Rounding Functions Were Altered To
99 C	Use ANINT (Whole Number) Command To
100 C	∴void Integer Overflow With %T & %R
101 C	Labelling
102 C	- Added Automatic Tick & Label Routines
103 C	To Select Preferred Values Based On
104 C	X & Y Scale Ranges. Defaults To 1/10
105 C	Of Scale For Entry Of An Anomalously
105 C	
100 C	Small Or Large Range.

107 C 108 C 109 C 110 C	- Added Code For Select Type (HP 9872A / HP 7 Adjustments To The PI Points To Fit Output Clip Limits Of Both F	7550A) And Made 1,P2 Scaling Within The Hard
112 C 113 C 114 C	Y-AXIS: Absorbance or Extinction Coefficie	ent
114 C 115 C 116 C	X-AXIS: Wavelength or Wavenumbers \times 1E-3
